## Particle Counting Methods & Impact on ISO Codes

### The Authors

CINRG manufactures particle counting, and robotic instrumentation for the oil analysis industry.

A manufacturer of world-class lubricants, specialty fluids and greases for over 30 years.

An oil analysis laboratory and service provider for 57 years. The leader in oil analysis.

**Alistair Geach**

**CINRG Systems Inc.**

Alistair has been in the oil analysis industry for 28 years, formerly with SetPoint Technologies in Africa. Alistair's unique skills in chemistry, physics and engineering have helped him in his career of laboratory automation and instrument development. Alistair is CLS, OMA I, LLA I certified.

# Fluid Cleanliness and Ghost Particles

## WHAT

Soft (or Ghost) particles are non-abrasive “particles” present in lubricating oils

## WHY

These particles cause laser light-scattering in optical particle counting instruments causing high ISO Cleanliness Codes

## WHY

OPA cannot distinguish between these soft (ghost) particles and true abrasive contaminants

## HOW

Using dilution for particle counting with the proper solvent produces accurate ISO Cleanliness Codes

ASTM INTERNATIONAL

## Why ASTM D7647?

Eliminates  
“soft particles”

- Water
- Additives
- Varnish Precursors

This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee.

Designation: D7647 – 10 (Reapproved 2018)

### Standard Test Method for Automatic Particle Counting of Lubricating and Hydraulic Fluids Using Dilution Techniques to Eliminate the Contribution of Water and Interfering Soft Particles by Light Extinction<sup>1</sup>

This standard is issued under the fixed designation D7647; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

1.1	Diluent	Is this a water-masking diluent?
1.1.1	Stoddard solvent, also called	no
1.1.2	Type 1 mineral spirits or white spirits	no
NOTE	kerosene	no
NOTE	lamp oil*	no
NOTE	25 % 2-isopropanol / 75 % toluene	yes
NOTE	dipropylene glycol n-propyl ether*	yes

## Solvents Investigated

Toluene/IPA 75/25%

Ethylene Glycol Butyl Ether (EGBE)

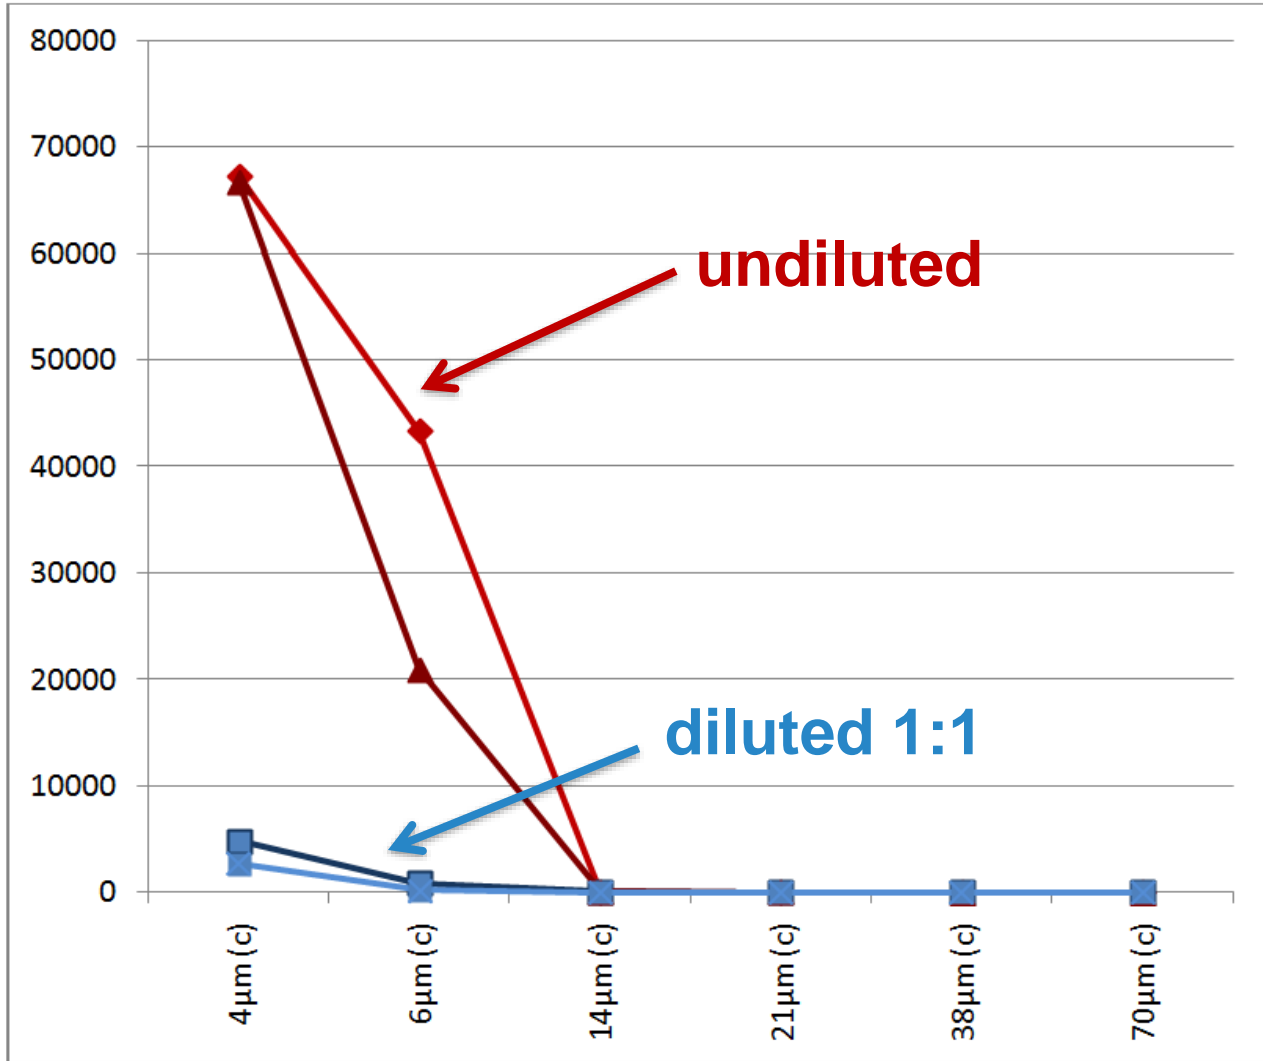

Dowanol (DPnP)

Kerosene

Varsol (Stoddard Solvent).

Kerosene / DPnP 67/33%

 NOTE: Filtration was performed using a laboratory filtration system

# What is the Issue with High Particle Counts?

- Same Oil Sample
- Results are different because they are based on ISO Particle Count using different solvents
- Kerosene vs. Toluene / IPA

1- Alistair Geach, William A. Quesnel; Particle Counting of Heavily Contaminated Oil Samples – OilDoc Conference, Rosenheim Germany, January 2015

**17/15/10**  
**Toluene/IPA**

**=\$93,100.00**

# Conclusions & Recommendations

# Questions?

- Water & “Soft” Particles increase the apparent ISO Cleanliness Code (soft particles include insoluble oxidation by-products and some oil additives)
- The dilution method for particle counting (ASTM D7647) mitigates or eliminates the effect of water and “soft” particles
- Not all solvents used for dilution have the same masking effect. 75% Toluene / 25% Isopropanol (IPA) is the most effective solvent mix for water and “soft” particles
- Ultra-fine filtration can lead to the removal of some oil additives (notably anti-foaming agents and detergency additives)
- Before taking action based on your oil samples ISO Cleanliness results, ensure that your laboratory is using the appropriate particle counting method
